

Design Process & Wireframing Quick Reference

A quick-reference companion to "The Design Process" and "Wireframing in Practice"

The four stages

- Discover — research the problem before proposing any solution.
- Define — frame the right problem to solve, based on what research turned up.
- Develop — explore and prototype multiple possible solutions.
- Deliver — test with real users, refine, and ship.

Keep it iterative

- Test early, rough ideas with real users instead of polishing in isolation.
- Be ready to loop back to Discover or Define if testing reveals a better problem to solve.

Wireframing basics

- Start with rough boxes and labels — resist the urge to pick colors or fonts yet.
- Focus each wireframe on layout, hierarchy, and flow between screens.
- Add just enough detail to communicate the idea to a reviewer or teammate.

Moving to high fidelity

- Validate the layout and flow with a wireframe first.
- Only move to color, type, and visual polish once the structure is confirmed.
